# Graphs and Networks Sep 7, 2010: Lecture 2 Daniel A. Spielman 

Graph Structure in the Web
Broder et. al., Computer Networks 33, (2000) pp.309-320

Altavista Crawl of 200M pages, 1.5B links

## Graph Structure in the Web

Broder et. al., Computer Networks 33, (2000) pp.309-320

For two random nodes, directed path exists with prob $25 \%$

## Graph Structure in the Web

## Broder et. al., Computer Networks 33, (2000) pp.309-320

Distances when there is a path:

| Edge type | In-links (directed) | Out-links (directed) | Undirected |
| :--- | :--- | :--- | :--- |
| Average connected distance | 16.12 | 16.18 | 6.83 |

Breadth-first search from random nodes in SCC:

| Measure | Minimum depth | Average depth | Maximum depth |
| :--- | :--- | :--- | :--- |
| In-links | 475 | 482 | 503 |
| Out-links | 430 | 434 | 444 |

As the table shows, from some nodes in the SCC it is possible to complete the search at distance 475 , while from other nodes distance 503 is required. This allows us to conclude that the directed diameter of SCC is at least 28 .

## Graph Structure in the Web

Broder et. al., Computer Networks 33, (2000) pp.309-320

| Starting point | OUT | IN |
| :--- | :--- | :---: |
| Exploring outwards - all nodes | 3093 | 171 |
| Exploring inwards - unexpected nodes | 3367 | 173 |

## Diameter in scientific collaborations

FIG. 3. Average distance between pairs of scientists in the various communities, plotted against the average distance on a random graph of the same size and average coordination number. The dotted line is the best fit to the data which also passes through the origin.

Mixing Patterns In Networks, M.E.J. Newman
Phys. Rev. E 67, 026126 (2003)

## Power-law degree distributions

Graph structure in the Web, Broder et. al., Computer Networks Vol 33, No 1-6 , June 2000, pp. 309-320

## Analysis of Web Graph

Graph structure in the Web, Broder et. al.,
Computer Networks Vol 33, No 1-6 , June 2000, pp. 309-320

Weakly-connected components (traverse edge either way) largest had 186 m pages $=91 \%$

Strongly-connected components (only following links)
largest had 56 m pages $=28 \%$

## Power-law degree distributions

Fig. 1. The distribution function of connectivities for various large networks. (A) Actor collaboration graph with $N=212,250$ vertices and average connectivity $\langle k\rangle=28.78$. (B) WWW, $N=$ $325,729,\langle k\rangle=5.46$ (6). (C) Power grid data, $N=4941,\langle k\rangle=2.67$. The dashed lines have slopes (A) $\gamma_{\text {actor }}=2.3$, (B) $\gamma_{w w w}=2.1$ and (C) $\gamma_{\text {power }}=4$.

Emergence of Scaling in Random Networks, Barabasi and Albert, Science, vol 286, 15 Oct 1999

## Power-Law Degree Distributions?

FIG. 1. Histograms of the number of collaborators of scientists in four of the databases studied here. The solid lines are least-squares fits to Eq. (罒).

FIG. 2. Histograms of the number of papers written by scientists in four of the databases. As with Fig. 11, the solid lines are least-squares fits to Eq. (1).
used. However, our data are well fitted by a power-law form with an exponential cutoff:

$$
\begin{equation*}
P(z) \sim p^{-\tau} \mathrm{e}^{-z / z_{c}}, \tag{1}
\end{equation*}
$$
